

Component	Request	Repons
Method	Get	—
Endpoint	/api/products?category = food	—
headers	Accept: application/json	content-type: application/json
Query Param	category = food	—
Status code	—	200 ok or 500 error
Data	empty	{ "id": 1, "name": "burger", "category": "food", price": 2993, ... }

”Act as a Backend Architect. Using Node.js and Express, create a modular folder structure. Write a products.js route file inside a routes/ folder, and a productsController.js inside a controllers/ folder. The route handles a GET request to /api/products and accepts a query parameter called category. The data is stored in a local JSON file (products.json). If the category is 'food', return only products in that category. Ensure the code follows the Controller–Route–Service pattern and has comments explaining each part.“
